Performance Report

Perpetual Futures Account — USDC Collateral
Author: Remi Roche — roche.remi@agialgo.com
Full period: March 4 – March 27, 2026 (20 days)

Strategy: Algorithmic cross-sectional rotation on cryptocurrency perpetual futures, driven by a topological data analysis (TDA) signal that detects structural regime shifts in the high-dimensional return space of ~180 assets. Profits are captured by an automated trailing mechanism that locks in gains before they revert.

Development timeline:
Mar 4-15: Initial deployment with mechanical stop loss. Result: -16%. Account reset to $100.
Mar 15-20: Trailing take profit (activation $5, drop $2). Result: +6%.
Mar 20-27: Optimized (activation $3, drop $1, no SL). Config tuning.
Mar 27+: Concentrated portfolio (2 assets) + limit orders. Currently live.
